INDUSTRIAL HARD CHROME PLATING - Chem Processing Inc.

Hard chrome plating is an electrolytic process in which chromium is deposited onto a metal substrate giving it enhanced properties for durability, wear and hardness. The electrolytic process is generally achieved by passing an electric current through a chromic acid solution (called an electrolyte bath)...

An introduction to hard chrome plating - SEA

More recently, composite chromium plating, which includes 4“11% Al₂O₃ or Si₃N₄ powder, has been proposed. 14 It has a higher wear resistance than conventional hard chromium plating. First, the ceramic powder is mechanically forced into the crack in the plated layer, then the additional chromium is overlaid.
